

Why Data structures and Algorithms are being used in this Rounds?

To test Can a single person have these abilities

- ① one problem → multiple solutions
- ② Explaining trade-off between multiple solutions which method is better in what circumstances and why.
- ③ Application of advanced concepts
Some data structures are hard to understand if a person have understanding capability and know their applications or not
- ④ Time Constraint 45 min to 60 min

The interview process remains same but based on the job role the depth of understanding of concepts changes

The candidate have to prove he/she is

- * Smart
- * problem solver
- * Understood computer science well
- * Able to write good code

Difficulty level of questions changes based on role

In online tests or paper pen test → The Question will be complete with proper input and output Example, which means they will explain Sample input & output, Data Range in I/p & O/p if input is Empty or Null what need to be done.

But in the face to face interview questions may be incomplete so ask clarification question in the interview

In the end the Interviewer expect Best, optimised (Time & Space complexity depending on problem) code and production ready code which handled all edge cases

In Written test write the code in such a way that

- 1) Clean code
- 2) Working code
- 3) Optimised code Based on application and tradeoffs
- 4) Edge cases Handled

In online test they have given a function to implement

Resources for Preparing Technical Interview Question

Books :-> There are 2 important Books

Online Tools

Top platforms & tools

1. **LeetCode** — best for company-tagged problems (FAANG-style). Great for timed practice and mock contests.
2. **HackerRank** — good for language practice, basics, and company screening tests.
3. **Codeforces** — competitive programming / algorithmic problem solving and contest practice. Great for speed and tough algorithmic thinking.
4. **InterviewBit** — guided interview track, curated progression from easy → hard with interview-focused explanations.
5. **GeeksforGeeks** — articles, explanations, common interview questions and patterns; good reference for theory and examples.
