

Restaurant Management System

DAY 144
01/Dec/2025

High-Level Design

Within this framework, three fundamental services need management:

- **Client Services**

Customers log in to place orders, track order status, and pay through multiple methods.

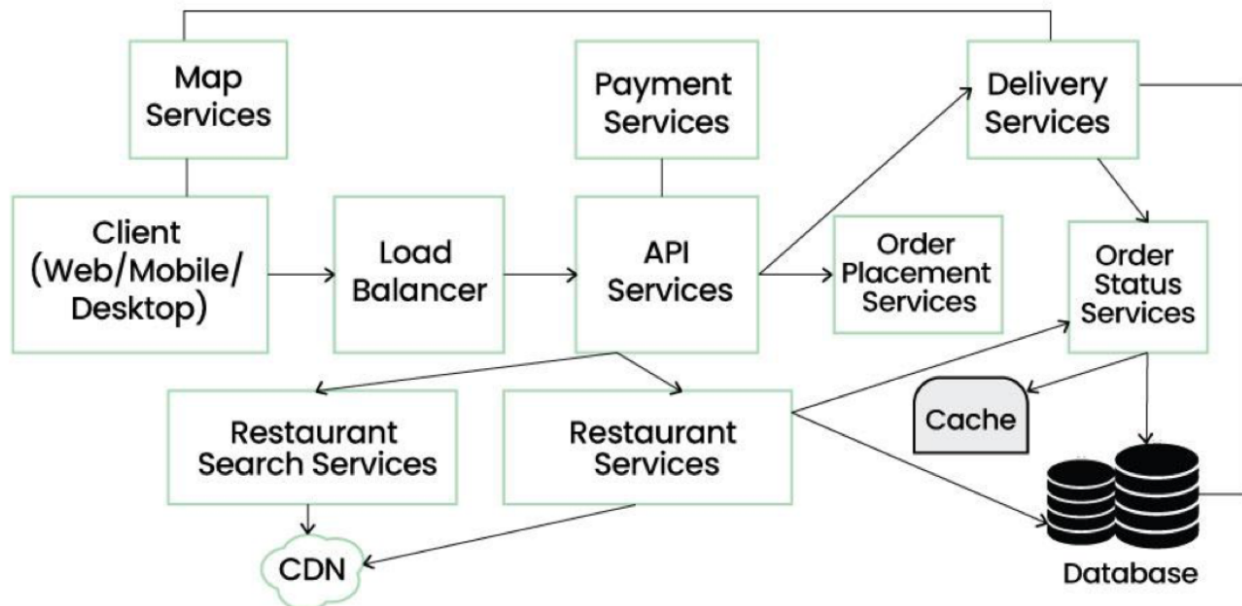

- **Restaurant Admin Services**

Admins log in to view, accept, and process orders (dine-in or delivery). They can also update menus, prices, and other restaurant details.

- **Delivery Services**

Delivery agents log in to receive nearby order notifications, use maps for location tracking, accept orders, and deliver them to customers.

Necessary Components in the High-Level Design of Restaurant Management System

- **Client Interface**
Customers use mobile, web, or desktop apps to access the system.
- **Load Balancer**
Distributes traffic across servers for high availability and performance.
- **Authentication & Registration**
Handles login and registration for customers, admins, and delivery agents.
- **Database**
Central store for users, restaurants, menus, orders, and metadata.
- **Payment Services**
Manages all payment transactions and data.
- **Order Services**
Handles order placement and processing.
- **Delivery Services**
Assigns delivery agents, supports tracking with Map Services.
- **Restaurant Admin Services**
Allows admins to view/manage orders and update menus, prices, and images.
- **Map Services**
Tracks customer and delivery agent locations in real time.
