

Why We Have standard libraries ?

While developing a software in that process it interact with file system, Network, Input output device and printer

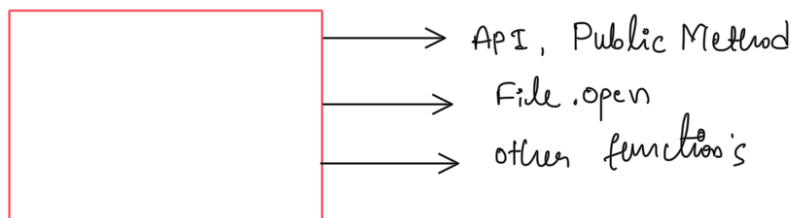

As we can see in the above diagram, the software needs to interact with different file storage systems, different network connections and protocols, different input output devices.

So if every time the software developer developing a software he needs to write code for interacting with every different files, networking, input/output types, to avoid this the standard libraries came into picture.

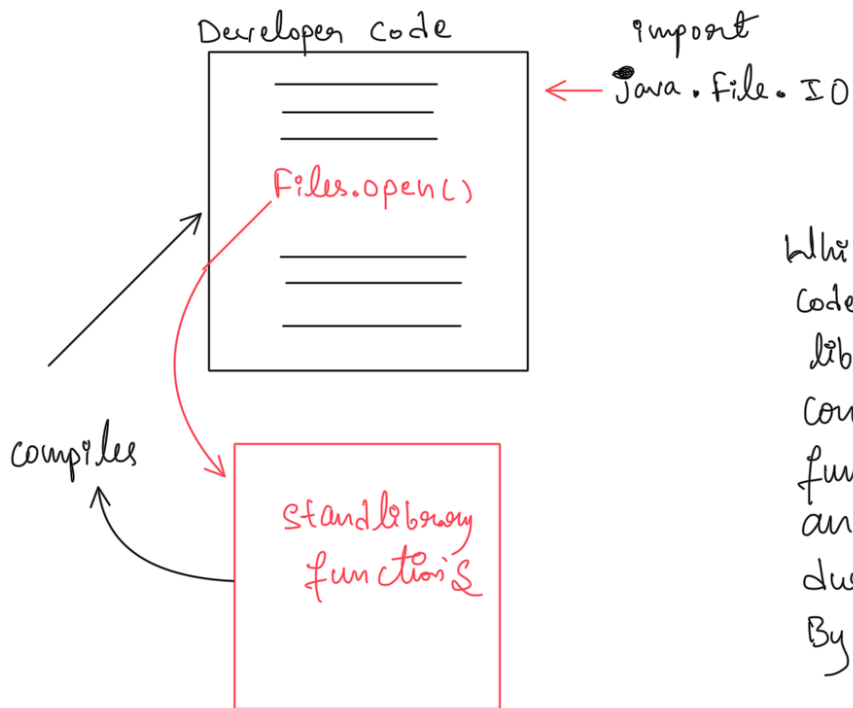

However they are reusable set of codes so they are already put in the standard input output libraries, so they are publicly exposed for reuse.

Standard libraries

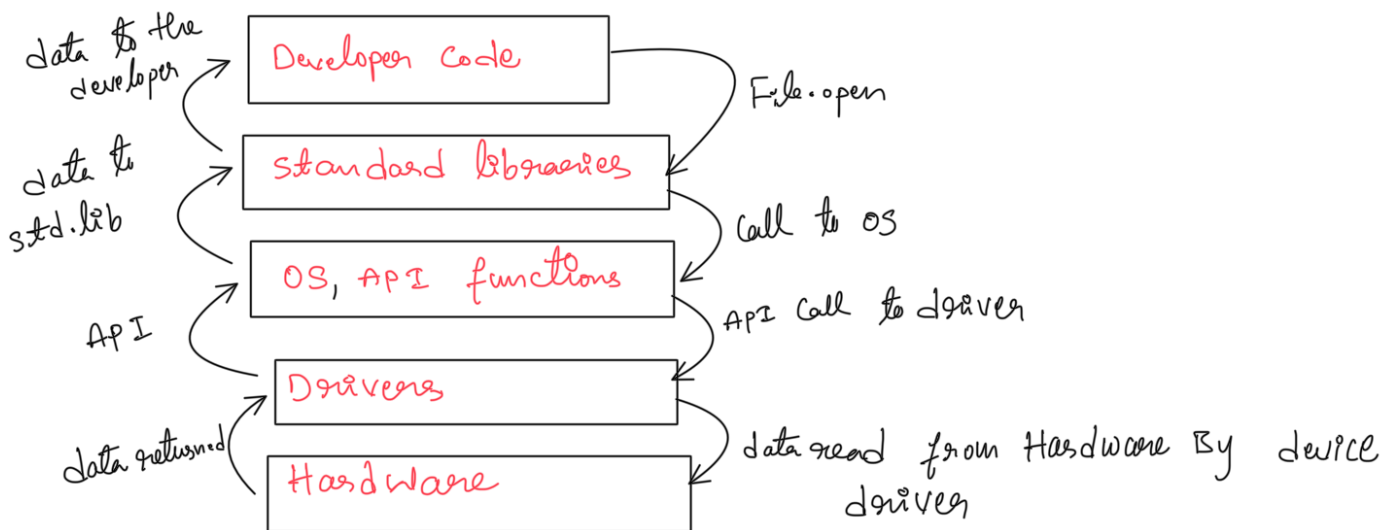

Functions

To understand any standard library we must have idea of functions, OOPS, Packages, Modules

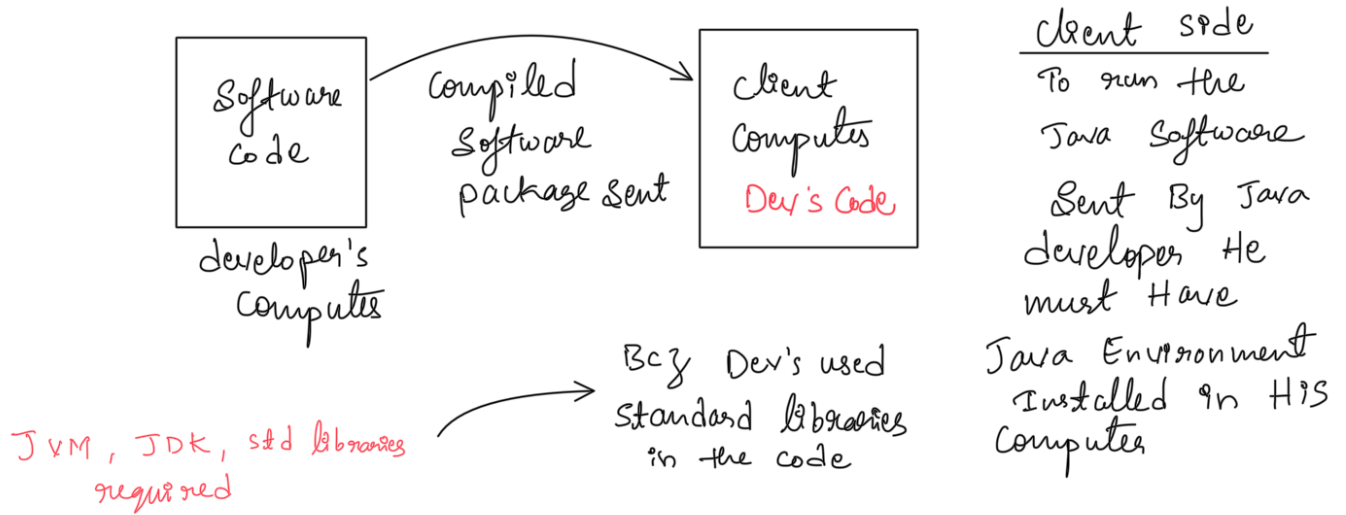

While compilation if the code included the standard library function then the compiler goes to the standard function which is imported and that will be compiled during execution and used by the compiler. The developer doesn't need to rewrite the code from scratch.

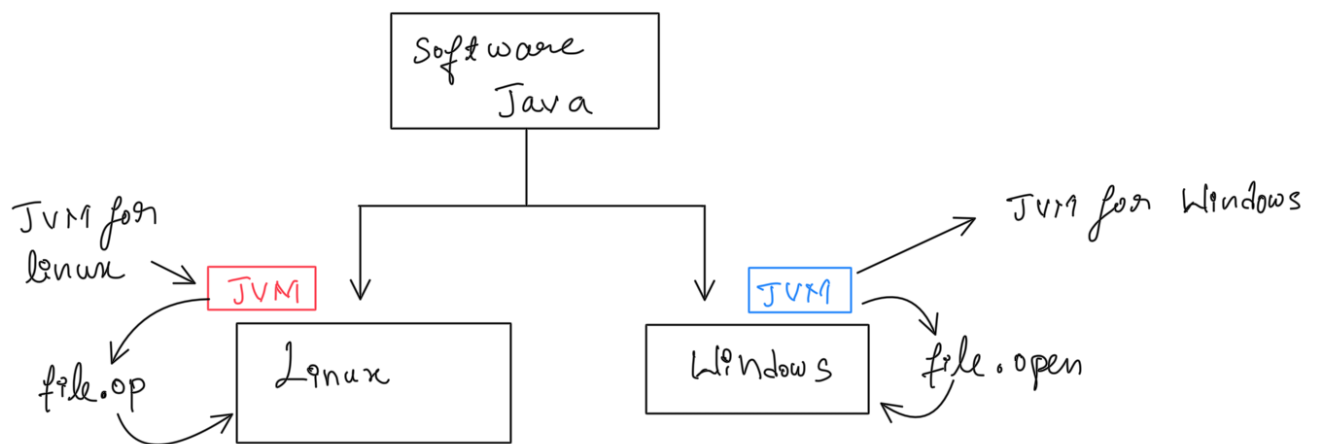

So this standard libraries played an important role for saving developers time and making software development faster.

How this work

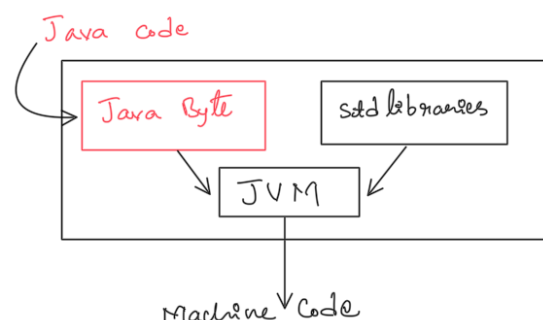

Write once use Anywhere

Same Java Software can be run on Both operating system using JVM

NOTE → JVM is different for different operating system.

Virtual Machine plays a translator role making java & standard libraries code Machine Independent code

JVM translates to Machine code

Reuse → Don't reInvent the wheel

Tomorrow I will Explore more about Standard Libraries
See you guys tomorrow
