

Technical Interview part 2

Day 97
15/10/2025

In a Face to Face Interview the problem statement is Incomplete
Intentionally the Interviewer gives a In Complete problem Statement

Important characteristic of a problem solver is actually taking a pause after reading question and trying to figure out what and all information is required to solve a given problem

Let Understand With Example

There is a set of numbers we have to identify duplicate numbers

What is the important information is needed to solve this problem

① list is sorted or unsorted / Sorted array or unsorted array

Bcz the approach to solve the problem is completely changes if its sorted.

Requirement collection

In the face to face interview ask the Interviewer about

① Data Range

② if data is null or empty what should I do

③ Ask for sample input and output to understand the problem well

Requirement collection helps to get complete understanding for a problem given in a interview

Interviewer intentionally given a incomplete problem statement to check whether the candidate ask questions related

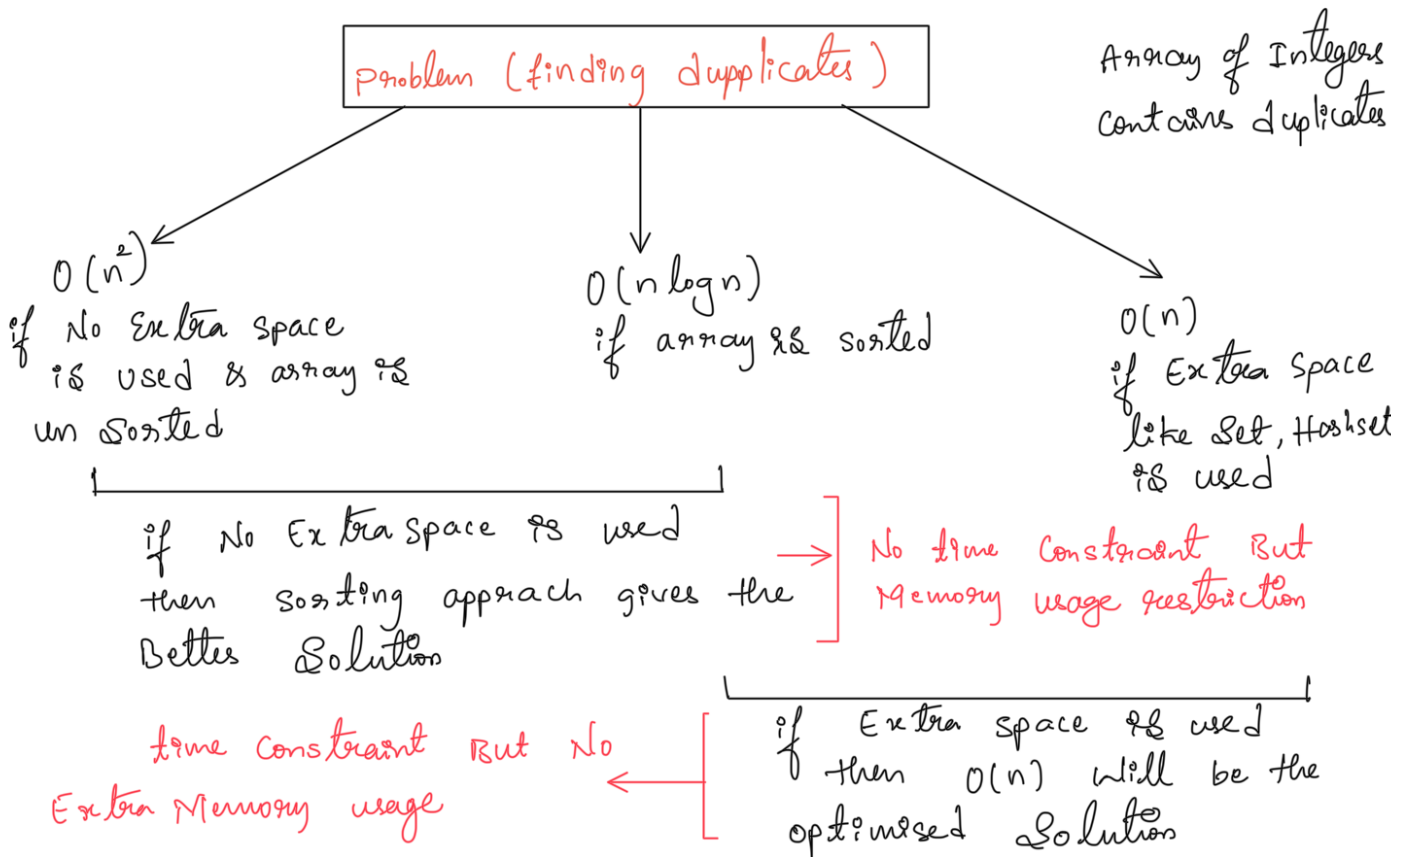

to requirement collection through which he can understand the problem come up with Multiple Solutions

So don't hesitate to ask questions to interviewer

Write down Entire Requirements: Input output Edge cases Corner cases
give them or ask them Some Input output Examples and
ask the interviewer is that correct.

Writing a Solution

In the very first go no one will expect optimised Solution from the candidate

True Engineering or Problem Solving is not about one problem and one solution

It's about one problem multiple solutions

and having ability of understanding the tradeoffs between multiple solutions and ability to explain it to interviewer

Understanding in which situation which solution is better

Brute force Approach

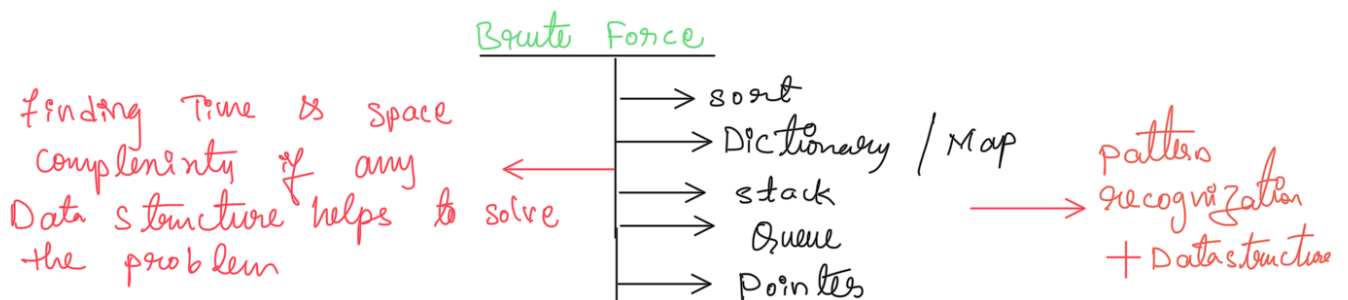

→ Understand How your Brain Solving a given Problem Manually

After figuring out Brute force approach you can optimise it later Based on Constraints

keep thinking about solution and asking question to the interviewer and explain your solution to the interviewer and get clarity whether you are doing right or need any corrections.

NOTE → Don't Hesitate to Speak out

after figuring out Brute force Approach try to optimise it with Data structures

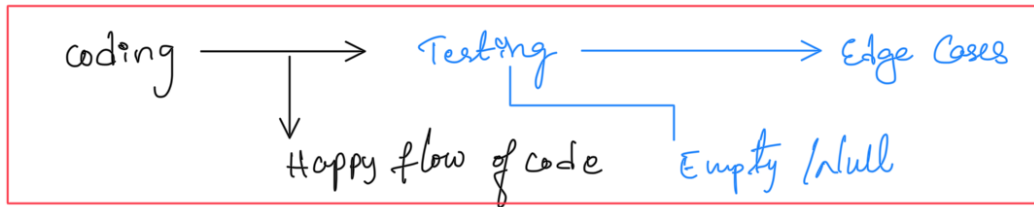

understanding of strengths and Weakness of Each Data structure and looking at problem solution and understand which Data structure will help.

If any Data structure Helps to Solve the problem then What will be the time & Space Complexity, if you can tell Multiple Solutions to the Same problem and describe pro's and Cons then you can really crack the problem Solving round or technical Round

If the Interviewer Satisfied with your Solution then start the Implementing part, Start Writing the code

One of the Important task while writing code is Testing

Write code Always in function
